Since each term in the polynomial is divisible by both x and 5, the greatest common factor is 5x. In factored form, the polynomial is written $5x(3x^2 + x - 5)$. (b) $18x^3y^5z^4 + 6x^2yz^3 - 9x^2y^3z^2$. The largest monomial by which each of the terms is evenly divisible, thus the greatest common factor, is $3x^2yz^2$, so factor it out. Factoring by grouping

A quadratic trinomial is factorable if the product of A and C have M and N as two factors such that when added would result to B. For example, let us apply the AC test in factoring $3x^2 + 11x + 10$. In the given trinomial, the product of A and C is 30. Then, find the two factors of 30 that will produce a sum of 11.
